

A photograph of a modern building entrance featuring a large, dark-colored matting system with a fine, grid-like texture. The matting covers the floor area leading into the building. In the background, there are glass doors and three large, cylindrical silver planters containing green foliage. The overall scene is brightly lit, suggesting an indoor or well-lit outdoor space.

That vital first impression

It should be welcoming, aesthetically pleasing and functional. It should do the job properly - collecting dirt and absorbing any liquids or moisture, thereby protecting the surrounding floor areas. It should minimise the risk of slipping and reduce cleaning costs with a lower impact in the environment.

Depending on the type of entrance you have you can customise the solution to fit your needs and interior. Grids, aluminium mats, scraper mats, combination mats and absorbent mats. When used in the right combination, they will make sure things are kept really clean indoors, and make sure the first impression stays.

- A scraper grid takes care of the worst of the dirt
- Customised entrances
- Washable absorbent mats
- Mats made from recycled PET bottles and recycled rubber
- Up to 5-year warranty
